

Data Uploader for SAP S/4HANA Cloud

A pragmatic, clean-core approach to recurring SAP data imports

The gap in SAP data imports

Standard SAP upload tools

Rigid formats, limited validation.

Full integration platforms

Oversized for simple recurring file imports.

Custom developments

Technical debt that breaks the clean core.

What the Data Uploader is

Side-by-side extension on SAP BTP

Standard SAP APIs only

No table manipulation, no core modifications

Configurable mapping for any file structure

Validation before a single record is posted

How it works

1. Export

The source system exports Excel or CSV.

2. Map

Mapping logic builds SAP-compliant API calls.

3. Validate

Structure and values checked, shown to the user.

4. Post

Records posted through standard API endpoints.

What you get

Configure once

After the one-time mapping, uploads take a few clicks.

No manual entry

No more keying in invoices, orders or memo requests.

Clean, upgradeable core

Standard APIs only – the core stays upgradeable.

Controlled and traceable

Duplicate prevention, audit trail, linked documents.

Available on
SAP Store

**Standard where possible.
Extension where necessary.
Complexity only where it
adds value.**

Even in greenfield SAP Cloud ERP landscapes, contracts, orders and timesheets keep living in surrounding systems – and their data has to reach SAP on a recurring basis.

The Data Uploader app closes that gap without a custom upload program and without an oversized integration project.
